[Links to Additional Information](#) | [Finding Test Results](#)  
[Term and Score Explanations](#) | [Comparing Test Results](#) | [Printing Test Results](#)

### Comparing California Standards Test (CST) Results

When comparing results for the CSTs, compare results only within the same subject and grade. That is, grade two English-language arts compared to grade two English-language arts or grade six mathematics compared to grade six mathematics. No direct comparisons should be made between grades or between content areas.

Two types of comparisons are possible: 1) comparing the average scaled score or 2) comparing the percentage of students scoring at each performance level. The reviewer may compare results for the same grade and subject across years within a school, between schools, or between a school and its district, county, or the state. When making comparisons, the reviewer should consider comparing the percentage of students scoring proficient and advanced, since the state target is for all students to score at or above proficient.

Comparisons may also be made by calculating the overall percentage of students within a school who scored proficient and advanced and comparing this to the overall percentage of students in another school, the district, the county, or the state who scored proficient or advanced. To do this first calculate the number of students who scored proficient and advanced for the subject area at each grade level ( $(\%PRO + \%ADV) \times \text{number tested for the grade and subject area} = \text{No. scored PRO/ADV}$ ). Then add the No. scored PRO/ADV for all grades and divide by the total enrollment.

### Comparing California Achievement Tests, Sixth Edition Survey (CAT/6 Survey) Results

#### Comparing Group Test Results

Since the CAT/6 Survey is unchanged from year to year and was administered in all California public schools, reviewers may compare the test results from year to year as well as between and among schools and/or districts for the tests administered during spring 2003 and spring 2004. The most defensible comparison is the Percent of Students Scoring At or Above the 50th NPR. This is the percentage of students in the group purported to have demonstrated achievement at or above grade level on each specific test. A number of comparisons are possible, each with its own set of cautions.

#### Same Year, Within School Comparisons

A reviewer may want to compare the performance of students at different grade levels within a school. Similarities and differences in student performance in the same subject may be seen by comparing the Percent of Students Scoring At or Above the 50th NPR for each grade. When making this comparison, it is important to remember that the number of students in each group affects the confidence of the inferences that can be made. The smaller the group the more cautious one should be in making comparisons. It is also important to note that the national norm groups to which California's students' scores are compared were unique for each grade level.

#### Same School, Different Years Comparisons

There are two ways to compare two years of data for the same school. One can look at a cohort comparison over time by following a group of students from grade-to-grade. For example, if 48% of a school's third graders scored at or above the 50th NPR in 2003 and 51% of the fourth graders scored at or above the 50th NPR in 2004, the school appears to be
